

# 4.3.15 Hazardous Substances

The following section provides the hazard profile (hazard description, location, extent, previous occurrences and losses, probability of future occurrences, and impact of climate change) and vulnerability assessment for the hazardous substances hazard in Essex County.

### 2020 HMP Update Changes

- The U.S. EPA Hazardous Waste Report was used to identify large quantity generators in Essex County. This was updated with 2017 data for the 2020 HMP.
- All subsections have been updated using best available data.
- Previous events between 2014 and 2019 were researched, with a comprehensive list of previous events in Appendix X.

# 4.3.15.1 Profile

### Hazard Description

Hazardous substances are substances that are considered severely harmful to human health and the environment, as defined by the United States Environmental Protection Agency (USEPA) Comprehensive Environmental Response, Compensation, and Liability Act (CERCLA) (Superfund Law). Many are commonly used substances which are harmless in their normal uses but are quite dangerous if released. The Superfund law designates more than 800 substances as hazardous and identifies many more as potentially hazardous due to their characteristics and the circumstances of their release (USEPA 2013). Superfund's definition of a hazardous substance includes the following:

- Any element, compound, mixture, solution, or substance designated as hazardous under section 102 of CERCLA.
- Any hazardous substance designated under section 311(b)(2)(a) of the Clean Water Act (CWA), or any toxic pollutant listed under section 307(a) of the CWA. There are over 400 substances designated as either hazardous or toxic under the CWA.
- Any hazardous waste having the characteristics identified or listed under section 3001 of the Resource Conservation and Recovery Act.
- Any hazardous air pollutant listed under section 112 of the Clean Air Act, as amended. There are over 200 substances listed as hazardous air pollutants under the Clean Air Act (CAA).
- Any imminently hazardous chemical substance or mixture which the EPA Administrator has "taken action under" section 7 of the Toxic Substances Control Act (USEPA 2013).

If released or misused, hazardous substances can cause death, serious injury, long-lasting health effects, and damage to structures and other properties, as well as the environment. Many products containing hazardous substances are used and stored in homes and these products are shipped daily on highways, railroads, waterways, and pipelines.

Transportation of hazardous substances on highways involves tanker trucks or trailers, which are responsible for the greatest number of hazard substance release incidents. New Jersey is composed of approximately39,000 miles of highway, many of which are used to transport hazardous substances (New Jersey Department of Transportation [NJDOT] 2019). These roads cross rivers and streams at many points; hazardous substance spills on roads have the potential to pollute watersheds that serve as domestic water supplies for parts of the State. Potential also exists for hazardous substance releases to occur along rail lines as collisions and derailments of train cars can result in large spills.

Pipelines can also transport hazardous liquids and flammable substances such as natural gas and petroleum. Incidents can occur when pipes corrode, when they are damaged during excavation, incorrectly operated, or damaged by other forces. In New Jersey, most of the large pipeline leaks have been caused by marine traffic hitting or the anchors of ships effecting pipelines in the waterways. In addition, hazardous substances can be transported by aircraft or by watercraft. Crashes, spills of materials, and fires on these vessels can pose a hazard.

Essex County hazardous materials response program has been in effect since 1999 with Nutley as the sole subcontractor for the County Environmental Health Act (CEHA) program. In 2004, Newark also became a subcontractor for hazardous material response for the CEHA program. Nutley handles all of the low concern and emergency responses within Essex County on a daily basis. The partnership between the Essex County Health Department (ECHD), Nutley and Newark have enabled Essex County to increase response capacity. Further, the County has created a mass decontamination program comprised of 10 Essex County municipal fire departments. The decontamination program includes the New Jersey Department of Health decontamination trailer that is operated by Belleville Fire Department. Because of several grants and other initiatives available much needed emergency equipment was purchased that is utilized for low concern, environmental emergency response and terrorist attacks.

### Location

The following provides information regarding the location of hazardous substance incidents.

### Hazardous Substances Fixed Site

Many years ago, numerous wastes were dumped on the ground, in rivers, or left out in the open. As a result, thousands of uncontrolled or abandoned contaminated sites were created. These sites included abandoned warehouses, manufacturing facilities, processing plants, and landfills. In response to concerns regarding health and environmental risks, Congress established the Superfund program in 1980 to clean up these sites. The Superfund program is administered by the USEPA in cooperation with individual states. In New Jersey, the Department of Environmental Protection (NJDEP) Site Remediation Program oversees the Superfund program (NJDEP 2013).

Federal regulations include the CERCLA and the Superfund Amendments and Reauthorization Act (SARA) required that a National Priorities List (NPL) of sites throughout the United States be maintained and revised at least annually (NJDEP 2013).

Fixed-site facilities that use, manufacture, or store hazardous substances in New Jersey pose risk and must comply with Title III of the federal SARA. SARA was signed into law on October 17, 1986. It is a federal law that applies nationwide. It must be realized that this law is linked to N.J.S.A. 34:5A, the New Jersey Worker and Community Right to Know Act. SARA requires the governor of each state to establish a State Emergency Response Commission (SERC). New Jersey's SERC was established by Executive Order on February 13, 1987. SARA also requires that the emergency planning districts be established by the SERC. The Act specified that these districts can be existing political subdivisions. The function of the emergency planning district is to facilitate preparation and implementation of emergency plans. In New Jersey, all municipalities and counties have been designated emergency planning districts (total of 588). The Local Emergency Planning Committees (LEPC) is the policy body for the emergency planning district (New Jersey Division of Fire Safety 2011).

The State enacted the Toxic Catastrophe Prevention Act (TCPA), N.J.S.A. 13:1K-19 et seq. Currently, implementation of the requirements established under this Act is facilitated by the TCPA Program. Certain industrial facilities using materials considered extraordinarily hazardous must take steps to prevent releases and protect public safety. New Jersey has also mandated that facilities storing large quantities of hazardous

substances take preventative measures to reduce the likelihood of a leak or discharge. Established under the New Jersey Spill Compensation and Control Act (N.J.S.A. 58:10-23.11), these requirements include testing and inspection of storage tanks, training of employees, and emergency response planning. The Discharge Prevention Containment and Countermeasure (DPCC) program facilitates implementation of these requirements. Regulations related to reporting of chemical and petroleum discharges are also administered under this program. The Program is sometimes referred to by the acronym DPCC, which refers to an important preparedness document that major facilities develop under the program (NJDEP 2018).

The Community Right to Know (CRTK) program collects, processes, and disseminates the chemical inventory, environmental release and materials accounting data required to be reported under the New Jersey Worker and Community Right to Know Act, N.J.S.A.34:5A and the federal Emergency Planning and Community Right to Know Act of 1986 (EPCRA). EPCRA is also known as Title III of the SARA. This information is used by the public, emergency planners, and first responders to determine the chemical hazards in the community (NJDEP 2012).

The U.S. EPA Hazardous Waste Report, which is a biennial report, collects data on the generation, management, and minimization of hazardous waste. This report provides detailed data on the generation of hazardous waste from large quantity generators and data on waste management practices from treatment, storage, and disposal facilities. This report lists 56 facilities in Essex County, with a majority of them located in the City of Newark (U.S. EPA 2017).

Superfund is a program administered by the U.S. EPA to locate, investigate, and cleanup the worst hazardous waste sites throughout the U.S. Data from the Comprehensive Environmental Response, Compensation, and Liability Information System (CERCLIS) database indicated that Essex County has 75 Superfund sites located throughout the County, with a majority of the sites located in the City of Newark (U.S. EPA 2019).

New Jersey employers, whose businesses are assigned North American Industry Classification System (NAICS) codes listed in the New Jersey Worker and Community Right to Know (CRTK) regulations, are required to submit CRTK surveys listing the environmental hazardous substances (EHSs) present at their facilities in quantities that exceed 500 pounds, unless the EHS is on the federal Emergency Planning and Community Right to Know Act (EPCRA) Section 302 list of extremely hazardous substances with a lower reporting threshold. In addition, Section 312 of EPCRA requires owners and operators of federal facilities and private sector facilities that are subject to the United States Occupational Safety and Health Administration's (OSHA) Hazard Communication Standard to report their inventories of any chemical that requires a Materials Safety Data Sheet (MSDS) and is present on site in quantities that exceed 10,000 pounds, unless the chemical is an Extremely Hazardous Substance with a lower reporting threshold (NJDEP 2014).

Owners and operators of manufacturing, and select non-manufacturing companies, having the equivalent of 10 or more full-time employees, and manufacturing, importing, processing or otherwise using toxic chemicals listed on the EPCRA Section 313 (TRI) list in quantities that exceed specified thresholds, are required to annually report their releases of these chemicals for the previous year. Approximately 500 New Jersey companies are required to file federal Toxic Chemical Release Inventory (TRI) forms. TRI Form R requires the listing of environmental releases, on-site waste management and off-site transfers while the simplified Form A Certification Statement requires the listing of the chemical only. These companies are also required to submit to NJDEP the Release and Pollution Prevention Report (RPPR) listing the quantities of environmental release, on-site waste transfer, and chemical throughput information. Most of these facilities are also subject to Pollution Prevention Planning Requirements and, therefore, required to report pollution prevention progress information on the RPPR (NJDEP 2014).

The NJDEP maintains a list of Known Contaminated Sites of New Jersey (KCSNJ). It is an inventory that includes all sites in the State where contamination is known to exist. The remediation for these sites is currently active or pending in the NJDEP's Site Remediation Program (SRP). As of 2017, there are over 14,000 KCSNJ sites in New Jersey, with 1,592 of those sites in Essex County.

# Hazardous Substances In-Transit

Incidents involving hazardous substances in transit can occur anywhere in the State. In Essex County, the major transportation routes include: the Garden State Parkway; I-280; I-80; and I-78. In total, there is approximately 1,767 miles of roadway in the County. Figure 4.3.15-1 shows the major transportation routes in the County.

Hazardous substances incidents may also occur along railways in Essex County. The NJDOT has a vital interest in preserving and improving the rail freight part of its transportation network. Rail shipments allow cost-effective movement of goods with less stress on the State's highway system. Major commodities shipped by rail entail petrochemicals (including plastic pellets), construction materials, food products, raw materials, and finished goods for manufacturers. Of concern for this hazard are rail cars carrying hazardous substances. An accident or release could pose a public safety hazard to the community.

Hazardous substances can also be transported via pipeline across the State. New Jersey has an extensive network of natural gas and petroleum pipelines. Several of the petroleum pipelines originate in the Gulf Coast region (Colonial Pipeline and Buckeye Pipeline). Figure 4.3.15-2 shows the extent and locations of pipelines throughout the northeastern United States.

# Hazardous Substances Offshore

Offshore hazardous substance incidents have the potential to affect New Jersey because of its vast coastline consisting of rivers, bays, and oceans. New Jersey is a vital link in marine transportation in the Northeast. The State has 14 ports, including the Port of New York and New Jersey, which are a critical link for shipping worldwide. The potential for a hazardous substances incident offshore is possible given the volume of shipping traffic around the State.

New Jersey features the Port of New York and New Jersey system, which includes the New Jersey ports of Port Newark, Elizabeth-Port Authority Marine Terminal, and Port Jersey. The Port of New York and New Jersey is the gateway to one of the most concentrated and affluent consumer markets in the world. It is the largest port on the east coast, and the third-largest port in the nation. In 2016 79,844,000 tons of cargo moved through Port facilities. This included over 6.25 million boxes (PANYNJ Port Planning Summit, 2017). The dollar value of all cargo that moved through the Port exceeded \$200 billion (PANYNJ, 2016). The Port ships a variety of goods, many of which are hazardous. Figure 4.3.15-3 shows the location of the Port of New York and New Jersey. Port Newark is located in the City of Newark, Essex County. Port Newark is managed by the Port Authority of New York and New Jersey (PANYNJ). The Port Newark Container Terminal (PNCT) is located in Port Newark and occupies 259 acres. It handles over 600,000 containers each year and is one of the largest infrastructure projects in New Jersey (PNCT 2014).

Source: Port Authority of New York and New Jersey 2013

### Extent

The extent of a hazardous substance release will depend on whether it is from a fixed or mobile source, the size of impact, the toxicity and properties of the substance, duration of the release, and the environmental conditions (for example, wind and precipitation, terrain, etc.).

Hazardous substance releases can contaminate air, water, and soils, possibly resulting in death and/or injuries. Dispersion can take place rapidly when the hazardous substance is transported by water and wind. While often accidental, releases can occur as a result of human carelessness, intentional acts, or natural hazards. When caused

by natural hazards, these incidents are known as secondary events. Hazardous substances can include toxic chemicals, radioactive substances, infectious substances, and hazardous wastes. Such releases can affect nearby populations and contaminate critical or sensitive environmental areas.

With a hazardous substance release, whether accidental or intentional, several potentially exacerbating or mitigating circumstances will affect its severity or impact. Mitigating conditions are precautionary measures taken in advance to reduce the impact of a release on the surrounding environment. Primary and secondary containment or shielding by sheltering-in-place measures protects people and property from the harmful effects of a hazardous substance release. Exacerbating conditions, characteristics that can enhance or magnify the effects of a hazardous substance release, include:

- Weather conditions, which affect how the hazard occurs and develops
- Micro-meteorological effects of buildings and terrain, which alters dispersion of hazardous substances on-compliance with applicable codes (such as building or fire codes)
- Maintenance failures (such as fire protection and containment features), which can substantially
  increase the damage to the facility itself and to surrounding buildings

As discussed earlier, the severity of the incident is dependent not only on the circumstances described above, but also with the type of substance released and the distance and related response time for emergency response teams. The areas proximate to the releases are generally at greatest risk; however, depending on the agent, a release can travel great distances or remain present in the environment for a long period of time (i.e. centuries to millennia).

The severity of offshore hazardous substances incidents will vary based on the amount of hazardous substance spilled, the location of the spill, and the prevailing currents. The effects of an accident can have a devastating impact on the environment. An example of the worst-case scenario was the Deepwater Horizon oil spill in 2010, which affected the gulf and the coastline from Texas to Florida and was one of the worst environmental disasters in the United States.

### **Previous Occurrences and Losses**

Many sources provided historical information regarding previous occurrences and losses associated with hazardous substance incidents throughout the State of New Jersey and Essex County. With so many sources reviewed for the purpose of this HMP, loss and impact information for many events could vary depending on the source. Therefore, the accuracy of monetary figures discussed is based only on the available information identified during research for this HMP.

Between 1954 and 2019, the State of New Jersey was not included in any FEMA declared disasters (DR) or emergencies (EM) related to hazardous substances incidents (FEMA 2019).

The U.S. Department of Transportation (USDOT) Pipeline and Hazardous Materials Safety Administration (PHMSA) provides an incident report database for information on incidents throughout the U.S. According to this database, between 2007 and 2014, there have been 198 incidents in Essex County (61 air; 135 highway; 2 rail) (USDOT 2018). Hazardous substances incidents on-site or in-transit occur frequently across the State and in Essex County. These incidents are typically small, localized events. The U.S. EPA maintains records of the amount of chemicals released at facilities each year. Between 2013 and 2017, Essex County had a total of 246,900 pounds released on-site and a total of 946,800 pounds released off-site (U.S. EPA 2019); refer to Figure 4.3.15-4. Onsite releases refer to emissions made from these respective facilities to the air, discharges to bodies of water, and disposal at the facility to land. Offsite released include various methods of disposal, such as landfills, surface impoundments, and underground injections (U.S. EPA 2019).

### Figure 4.3.15-4. Hazardous Substances Released in Essex County, Off-Site and On-Site

Source: EPA TRI Explorer 2019

For the 2020 HMP update, known hazardous substances incidents that have impacted Essex County between 2014 and 2019 are identified in Table 4.3.15-1. Refer to Section (Jurisdictional Annex) 9 for detailed information regarding impacts and losses to each municipality.

# Probability of Future Occurrences

Predicting future hazardous substance incidents in Essex County is difficult. They can occur at anytime and anywhere in the County. Incidents can be sudden without any warning or slowly develop. Small spills, both fixed site and in-transit, occur throughout the year and the probability for these events are high. The risk of major incidents in a given year is rare. Significant events occurring offshore are rather rare in New Jersey and in Essex County. However, with the port systems and waterways in Essex County, the possibility for a significant offshore incident does exist.

In Section 4.4, the identified hazards of concern for Essex County were ranked. The probability of occurrence, or likelihood of the event, is one parameter used for hazard rankings. Based on historical records and input from the Steering and Planning Committees, the probability of occurrence for the release of hazardous substances in the County is considered 'frequent'. It is estimated that the County will continue to experience direct and indirect impacts of hazardous substance incidents annually that may induce secondary hazards such as infrastructure deterioration or failure, water quality and supply concerns, and transportation delays, accidents and inconveniences.

# **Climate Change Impacts**

Hazardous substance incidents are non-natural incidents; therefore, there are no implications for impacts from climate change. Secondary impacts, such as excessive heat on containers may occur, but also can occur during normal fluctuations in temperature.

#### Table 4.3.15-1. Hazardous Substances Events in Essex County, 2014 to 2019

Date(s) of Event	Event Type	FEMA Declaration Number (if applicable)	Essex County Designated?	Description
2014	Accidents Involving Hazardous Substances	N/A	N/A	In 2014, Essex County experienced 17 air accidents, 49 highway accidents, and one rail accident involving hazardous substances.
May 19, 2014	Hazmat-in transit	N/A	N/A	On 5/19/14 driver was loaded with 7500 gallons of lysergic acid diethylamide and end route to delivery destination in Flemington NJ. While in approach to the traffic circle at Mine ST & Route 12 driver tried to avoid a vehicle that entered his path which resulted in the truck and trailer overturning. Clean up crews started pumping the product in the roadway into a small oil truck (1,650 gallons) and into large storage totes and barrels (950 gallons). 3,901 gallons was salvage and pumped from the trailer into a hired tanker and was delivered to original delivery destination
2014	Chemical Release	N/A	N/A	In 2014, 166,229 pounds of chemicals were released off-site and 84,576 pounds were released on-site in Essex County
2015	Accidents Involving Hazardous Substances	N/A	N/A	In 2015, Essex County experienced 23 air accidents, 49 highway accidents, and one rail accident involving hazardous substances.
2015	Chemical Release	N/A	N/A	In 2014, 126,214 pounds of chemicals were released off-site and 46,378 pounds were released on-site in Essex County.
2016	Accidents Involving Hazardous Substances	N/A	N/A	In 2016, Essex County experienced 21 air accidents, 37 highway accidents, and no rail accident involving hazardous substances.
2016	Chemical Release	N/A	N/A	In 2016, 236,392 pounds of chemicals were released off-site and 37,480 pounds were released on-site in Essex County.
2017	Chemical Release	N/A	N/A	In 2017, 188.5 thousand pounds of chemicals were released off-site and 26.3 thousand pounds were released on-site in Essex County.

Source: North American Hazmat Situations and Deployments Map 2014; NJ HMP 2019; EPA TRI Explorer 2019

With hazardous substances incidents for New Jersey and Essex County being so extensive, not all sources have been identified or researched. Therefore, **Error! Reference** source not found. may not include all events that have occurred in the County.

# 4.3.15.2 Vulnerability Assessment

To understand risk, a community must evaluate what assets are exposed or vulnerable to the identified hazard. The following discusses Essex County's vulnerability, in a qualitative nature, to the hazardous substances hazard.

### Impact on Life, Health and Safety

Depending on the type and quantity of chemicals released and the weather conditions, an incident can affect larger areas that cross jurisdictional boundaries. When hazardous substances are released in the air, water or on land they may contaminate the environment and pose greater danger to human health. The general population may be exposed to a hazardous substances release through inhalation, ingestion or dermal exposure. Exposure may be either acute or chronic, depending upon the nature of the substance and extent of release and contamination.

Due to the location of these different hazardous substances and wastes sites in Essex County, the entire County is considered vulnerable to this hazard. When examining fixed sites, the City of Newark has the greatest number of facilities that generate large quantities of hazardous waste and has the greatest number of Superfund sites. Further, Port Newark is located in the City of Newark making it more vulnerable to hazardous substances releases.

Those particularly vulnerable to the effects of hazardous substances incidents are populations located along major transportation routes because of the quantities of chemicals transported on these major thoroughfares. Potential losses from hazardous substances incidences include human health and life and property resources. These types of incidents can lead to injury, illnesses, and/or death from both the involved persons and those living in the impacted areas. Human safety and welfare can become compromised from negative health effects of poisoning or exposure to toxic substances, fires, or explosions.

#### **Impact on General Building Stock**

Potential losses to the general building stock caused by a hazardous substance's incident is difficult to quantify. The degree of damages to the general building stock depends on the scale of the incident. Potential losses may include inaccessibility, loss of service, contamination and/or potential structural and content losses if an explosion occurs. The closure of waterways, railroads, airports and highways as a result of a hazardous substance incident has the potential to impact the ability to deliver goods and services efficiently. Potential impacts may be local, regional, or statewide depending on the magnitude of the event and level of service disruptions.

### Impact on Critical Facilities

Potential losses to critical facilities caused by a hazardous substance's incident is difficult to quantify. Potential losses may include inaccessibility, loss of service, contamination and/or potential structural and content losses if an explosion occurs. Refer to Section 3 (County Profile) which summarizes the number and type of critical facilities in Essex County.

#### **Impact on Economy**

If a significant hazardous substances incident occurred, not only would life, safety, and building stock be at risk, but the economy of Essex County would be affected as well. A significant incident in an urban area may force businesses to close for an extended period of time because on contamination or direct damage caused by an

explosion, if one occurred. The exact impact on the economy is difficult to determine, given the uncertain nature of the size and scope of incidents.

Hazardous substances incidents have the potential to lead to major transportation route closures to occur in Essex County. If an incident occurred that would require one of the State's major highways to close, the impact on the economy could be significant. Given the scope and importance of New Jersey's transportation routes to the greater northeastern United States, the vulnerability of New Jersey's economy is significant.

### Future Changes that May Impact Vulnerability

Understanding future changes that impact vulnerability in the County can assist in planning for future development and ensuring that appropriate mitigation, planning, and preparedness measures are in place. The county considered the following factors to examine potential conditions that may affect hazard vulnerability:

- Potential or projected development.
- Projected changes in population.
- Other identified conditions as relevant and appropriate, including the impacts of climate change.

### Projected Development and Change in Population

As discussed in Sections 3 and 9, areas targeted for future growth and development have been identified across Essex County. Any areas of growth could be potentially impacted by hazardous substances incidents because the entire County is exposed and vulnerable. An increase in development and population has the ability to increase the likelihood of a hazardous substance incident. Future migration to larger jurisdictions may also increase the likelihood of an incident. Please refer to the specific areas of development indicated in tabular form and/or on the hazard maps included in the jurisdictional annexes in Volume II, Section 9 of this plan.

According to population projections from the State of New Jersey Department of Labor and Workforce Development, Essex County will experience an increase in population through 2034 (approximately 40,000 people between 2017 and 2034). An increase in the overall population will lead to an increase in the number of people exposed to a hazardous substance release within Essex County.

#### Climate Change

Because a hazardous substance incident is human-caused hazard, no climate change impacts are associated with the hazard.

#### **Change of Vulnerability Since the 2015 HMP**

Overall, the County's vulnerability has not changed, and the entire County will continue to be exposed and vulnerable to hazardous substances incidents.
